FAV2/FAV4	recall preset 2	recall preset 4
VOL +	turn up the volume in the zone	turn up the volume in the zone
VOL -	turn down the volume in the zone	turn down the volume in the zone

# RC-CONTROL - audio wall controller

## Controller Setup:

### 1. Connecting to an existing WIFI network

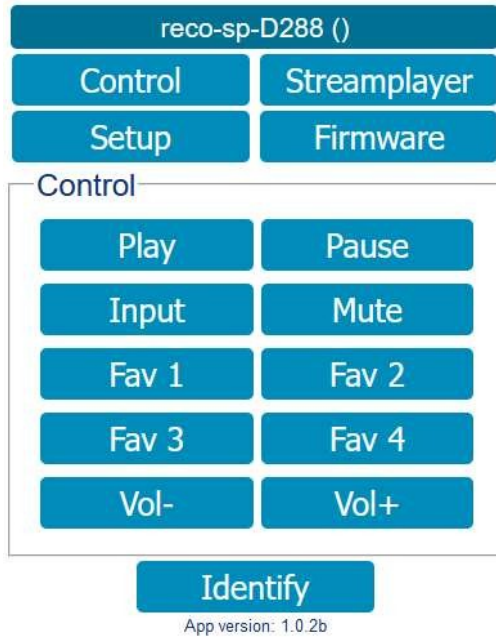

The screenshot shows the web interface for the RC-CONTROL audio wall controller. At the top, there is a dark header with navigation arrows, the text "Log In to Captive Wi-Fi", and a "Cancel" button. Below this is a blue bar with the text "reco-sp-D288". The main content area is titled "Wifi Config" and contains several elements: a blue "Scan" button, three input fields labeled "AP SSId", "AP Password", and "Hostname" (with "reco-sp-D288" entered), a "Save & Reboot" button, and a "Firmware Update" section with a "Choose File" button and an "Upload" button. Below the "Upload" button, there is a line of text that is partially cut off: "After clicking upload it will take some time for the file to upload".

- 1.1 After connecting the power supply, the PLAY and STOP lights on the controller flash at the same time (the controller is in AP mode)
- 1.2 Connect your phone or computer to the "reco-sp-XXXX" WIFI network (XXXX is the last 4 numbers from the MAC address)
- 1.3 After connecting to the WIFI, it will automatically open the login window for wifi logins (Picture 1). If the window does not open automatically, enter the address 192.168.4.1 in the browser
- 1.4 Note the name of the wifi SSID (reco-sp-XXXX) or hostname after login to the controller. It will be used in the next step.
- 1.5 Type your ssid and password of your private wifi network (you can write directly or find available networks by SCAN button.
- 1.6 After filling, press the SAVE & REBOOT button. The controller will restart and will try to connect to your private WIFI network. If the controller connects to your network successfully, the PLAY button LED will flash green every 3 seconds.

---

## 2. Setup the controller with existing LinkPlay device:

2.1 Type “reco-sp-XXXX.local” in your internet browser (reco-sp-XXXX is the hostname of the controller in the first setup).

2.2 You will get the main page (picture 2)

2.3 Go to the STREAMPLAYER page

### Notes

You can use this web interface also for controlling selected LinkPlay players with basic functions..

Button “Identify” is useful when you have several controllers on the network to find the proper controller.
